

TRACKER

The Canada Tech Tracker records depth and tension data and has been designed to revolutionize the slickline industry.

During the operation of a normal slickline job, the Tracker records depth, speed and tension data. When combined with a pressure/temperature sensor, the Tracker will create a log file with corresponding depth, speed, tension, pressure and temperature to that point in time. In doing so, the Tracker will provide relevant time sensitive data.

The Tracker panel provides clear-cut data on depth, speed and tension. As a self-contained portable unit, the Tracker is protected by a water-proof case which also carries a rechargeable battery.

There are two methods to setup the Tracker; through the front keyboard which is connected to a computer (serial port available) or with a handheld Palm device.

Features

- Real-Time Depth/Speed and Tension Data
- Display Panel
- Self-Contained Portable Unit
- Water Resistant Protective Casing
- Rechargeable Battery
- Digital Event Job Log
